

## **Electrical Clarification:**

Hello

I talked to Jim Doane, and we are planning to change the box and keep the 100 amp service. We are adding AC to the office area at a later date and will need 220 volt service for that equipment, but the only other large electrical demand is the kitchen range. The remainder of the electrical load is from lighting, wall outlets, furnace blower, and on demand hot water control. I talked to Tom Whispel a couple of months ago asking if we would be required to bring the electrical system up to current codes if we kept the 100 amp service but installed a new CB panel. He said our current system would be grandfathered, we could change the CB box without bringing everything up to code.

Let me know if that answers your electrical question.

Thanks

Ed
